SUMMARY

Results-driven Software Developer with a B.S. in Computer Science (GPA: 3.7) and demonstrated success in leading team projects, architecting full-stack applications, and delivering high-quality products. Combines strong back-end development skills in Python and Java with front-end proficiency in React and React Native. Seeking a software engineering role to apply technical expertise and collaborative skills to build innovative solutions.

WORK EXPERIENCE

Team Lead & Lead Dev (Capstone Project) | CSUSM & Pacific Islander Community Health

San Marcos, CA

*Led a team of 4 developers to architect a cross-platform community resource hub in **React Native** for the Pacific Islander and Latino communities.*

- Acted as the primary technical liaison between the development team and non-technical client stakeholders, translating project requirements into actionable development tasks and sprint goals.
- Engineered a database-less backend by integrating the Google Calendar API and Google Forms, enabling client admins to manage events seamlessly and reducing infrastructure complexity.
- Designed and implemented the core application architecture and UI/UX skeleton using React Native and Expo, establishing the foundational structure for all subsequent feature development.
- Mentored junior team members in Git version control, introducing branching strategies that improved workflow efficiency and enabled parallel development on multiple features.

Hardware Specialist & Small Business Owner | Self-Employed

Engineered and fabricated over 100 custom-tuned competitive gaming controllers, achieving an average of 5/5 rating across 76 customer reviews.

- Performed intricate hardware modifications, including desoldering components and soldering onto custom-designed PCBs to enable advanced functionality like stick-profile tuning and button remapping.
- Delivered exceptional customer service and technical support, expertly guiding clients through complex tuning processes to tailor device performance to their unique preferences.
- Optimized device hardware through precision shell modifications, enabling users to achieve specific input values critical for high-level competitive play.
- Managed all aspects of the business, from sourcing components and manufacturing to client communication and quality assurance, consistently praised for product quality and responsiveness.

PROJECTS

Gloomhaven Monster Tracker | React

Developed a web application to digitize and streamline the monster tracking system for the board game Gloomhaven, drastically improving gameplay and setup

- Built a dynamic interface in React that automatically calculates and displays monster stats based on user-selected levels
- Utilized a custom JSON file to manage all monster data, allowing for instant retrieval and display of information for any monster in the game and update in real time
- Implemented interactive UI elements allowing users to easily track health changes and status effects for multiple monsters, eliminating the need for cumbersome physical tokens.

Dungeons and Dragon 5e Character Creator | Java

OOP Co-developed a backend system for a Dungeons & Dragons character creator as part of a collaborative software engineering course project.

- Engineered an expandable, object-oriented inventory system in Java, allowing for the easy addition of new items without modifying core code.
- Designed and implemented a stateful dice rolling system that accurately mimics real-life dice rolls and allows users to assign, track, and undo stat allocations.

EDUCATION

Cal State San Marcos

San Marcos, CA

B.S in Computer Science, Cum Laude Honors, 3.7 GPA

Class Experience: OOP, Data Structures and Algorithms, Networking, Cloud Computing, Web Programming, Databases, Computer Theory, Operating Systems, AI, Software Development, AGILE, SCRUM,

TECHNICAL SKILLS

Languages: Python, React, Go, Java, C++, PHP, SQL

Tools: VSCode, JetBrains IDEs, Git and GitHub, Linux, Docker, Markdown, CLI and VIM
